approach	balances	updated	failure mode
Router bias (decks 55, 56)	batch-average expert load	from the previous step	**one micro-batch can still skew**
Offline replicas (EPLB, DeepSeek-V3)	historical GPU load	~every 10 minutes	**stale when routing drifts**
Capped cloning (ECHO, UltraEP)	current micro-batch	every forward	**stops when no plan fits the cap**
